

# Cognitive Performance Analysis Report

Generated: December 09, 2025 • Total Records: 168

Color Guide: Red = Positive correlation ( $X \uparrow \rightarrow Y \uparrow$ ) • Blue = Negative correlation ( $X \uparrow \rightarrow Y \downarrow$ ) • White = Weak/no correlation

# AI Analysis Summary

Automated insights generated from correlation data

---

## KEY FINDINGS

- High protein intake is strongly associated with improved verbal memory and reaction times.
- Increased sleep hours correlate positively with both reaction times and memory scores.
- Higher active energy expenditure is linked to better performance in sequence and verbal memory tasks.

## STRONGEST CORRELATIONS

- Protein\_g: 0.9578 with verbal\_memory\_words - indicates a very strong relationship suggesting protein intake may enhance verbal memory.
- Sleep\_hours: 0.9416 with reaction\_time\_ms - suggests that more sleep is associated with faster reaction times.

## LIMITATIONS

- The dataset consists of 168 records, which may limit the generalizability of the findings.
